                                                                                                                                                                                                                                              The present sequence represents a protein of 166 amino acids. The sequence is disclosed as being a protein called mack which regulates cell death through interaction with Bcl-2. The DNA may be used for the production of the recombinant protein, which can be used in unspecified therapeutic or diagnostic procedures, as a molecular weight marker, and to raise antibodies that can be used in unspecified diagnostic or therapeutic applications and to reduce or eliminate the biological activity of the BBC5 protein in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 1997-447980/41

Bad can be used in screening assays for compounds to treat or prevent diseases characterised by apoptotic cell death, such as neurodegenerative disorders, e.g. Alzbelmer's and Parkinson's disease, amystrophic lateral sclerosis, rettricks pigmentosa and cerebellar degeneration, and myslodysplastic syndromes, e.g. aplastic anaemis and ischemic injury including myocardial infarction, stroke and reperfusion injury. Assays can also be used to obtain apoptosis enhancing compounds to treat or prevent diseases characterised by the loss of apoptotic cell death, such as concers, e.g. systemic lupus erythematosus and immune-mediated observes, e.g. systemic lupus erythematosus and immune-mediated plomerulonephritis and viral infections, e.g., heppewrius, or approach of apoptoric or adenovirus infections. Bad can also be used for prevent or and disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

This protein, which CC shares structural and chemical homology with Bel.2, is involved in cell CC proliferation. Its coding sequence was isolated by screening a symovial tissue cDNA library using a computer search for anino acid sequence CC alignments. The gene and protein can be used in the treatment of various cancers, disorders with associated in the such as Addison's CC cancers, adult respiratory distress syndrome, allergise, anemia, asthwa, cC disease, adult respiratory distress syndrome, allergise, anemia, asthwa, CC atheroscierosis, Crohn's disease, ulcerative collis, diabetes mollitus, caphysema, glomecrulonephritis, gover disease, irritable bowel CC syndrome, lupus crythomatosus, multiple sciencesis, myasthenia gravis, CC myocardial or pericardial inflammation, osteoporosis, rheumatoid compositis, sjogren's syndrome and autolmune thyroiditis, complications of cancer, haemodialysis and extracorporeal circulation, infections, content of sorders with associated apoptosis including AIDs and other traums, disorders with associated apoptosis including AIDs and other the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the con

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an isolated or synthetic polypeptide (1) comprising a less than full length amino acid sequence of a mutant CC Boll NL/Boll 2 associated cell death regulator polypeptide (BAD) or its fragment, which contains amino acid substitutions at serils of a human CC BAD, Seril5 of a murine BAD) (1) has immunostimulant, neuroprotective, mootropic, antisischaemic, vulnerary, cytostatic, antiviral, contains an apoptosis inducer or inhibitor. BAD polypeptides and compounds and apoptosis inducer or inhibitor. BAD polypeptides and compounds and apoptosis inducer or inhibitor. BAD polypeptides and compounds and drugs of oplynucleotides can be used for screening candidate compounds and drugs inducting or inhibiting apoptosis in a cell. Candidate compounds compounds and compounds and compounds and compounds and compounds and compounds of inducting or inhibiting apoptosis in a cell. Candidate compounds conditions of inducting or inhibiting apoptosis in a cell. Candidate compounds conditions are useful in treating communodeficiency diseases, neurodegenerative diseases, ischaemic cell death, reperfusion cell death, sequence represents a specifically contoning the present sequence represents a specifically contoning the present sequence represents a specifically contoning the present sequence represents a specifically contoning the present sequence represents a specifically contoning the present sequence represents a specifically contoning the present sequence represents a specifically contoning the present sequence represents a specifically contoning the present sequence represents a specifically contoning the present sequence represents a specifically contoning the present sequence represents a specifically contoning the present sequence represents a specifically contoning the present sequence represents a specifically contoning the present sequence represents a specifically contoning the present sequence represents a specifically contoning the present sequence represents a specifically contoning the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to methods of altering the polypeptide levels in a cell. using proteins selected from S-phase kinase associated proteins a lead 2 (SKPI, SKP2) SKP2-like proteins (SF) and CUL-1 (a member of the cullin/ CDC53 family of proteins). The method is useful for altering the level of p27, cyclin B. Max, Mad, c-Myc, MMW2, P53, Bax, Bad or Bol-2 polypeptide in a cell. SKP2 and SKP2-like protein levels are useful for detecting thmours, and in monitoring tumor treatment in a mammal. Agents that modulate interactions between SKP and target proteins are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modulating polypeptide levels in a cell, diagnosing and treating tumor, involves altering levels of proteins such as S-phase kinase associated proteins 1, 2 and cullin/CDC53 proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAG67688 standard; Protein; 168

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a human protein which is associated with cell proliferation, designated APOP-1. The specification also describes APOP-2 and APOP-3. The APOP polypeptides are useful for diagnosing, preventing or treating disorders associated with abnormal cell proliferation and apoptosis. The polypeptides and composition are particularly useful for treating or preventing cancer (e.g. brain or breast cancer), a disorder associated with an increase in apoptosis (e.g. Alzheimer's disease or Parkinson's disease) or inflammation (e.g. allorgies, gout, osteoarthritis or bronchitis).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptides associated with cell proliferation, useful for preventing or treating cancer (e.g. brain cancer), a disorder associated with an increase in apoptosis (e.g. Alzheimer's disease) inflammation (e.g. gout)

The present invention describes an isolated or synthetic polypeptide (1) comprising a less than full length amano acid sequence of a mutant CC Bcl XL/Bcl-2 associated cell death regulator polypeptide (BAD) or its fragment, which contains amino acid substitutions at Serila of a human CC BAD, Seril5 of a murine BAD) (or per murine BAD) or Seril3 of a murine CC BAD, Seril5 of a murine BAD) (i) has immnostimulant, neuroprotective, notropic, antischemic, vulnerary, cytostatic, antiviral, controlic, antiinflammatory and immunosuppressive activities, and CC can be used as an apoptosis inducer or inhibitor. BAD polypeptides and cut can be used for screening candidate compounds and drugs of oplynucleotides can be used for screening candidate compounds and drugs (activity that promote cell survival or apoptosis. Other uses include inducting or inhibiting apoptosis in a cell. Candidate compounds conducting or inhibiting apoptosis in a cell. Candidate compounds conducting or inhibiting apoptosis in a cell. Candidate compounds conducting or inhibiting apoptosis in a cell. Candidate compounds conducting or inhibiting apoptosis in a cell. Candidate compounds conducting or inhibiting apoptosis in a cell candidate compounds conducting or inhibiting apoptosis in a cell candidate compounds conduction. The prefinsion cell death, reperfusion cell death, wound healing, cancer, viral infections, limphoproliferative conditions, arthritis, infertility, inflammation and cutoimmune diseases. The present sequence represents a BAD BHJ domain constitution in the present sequence represents a BAD BHJ domain constitution in the present sequence represents a BAD BHJ domain constitution.

```
The present invention describes an isolated or synthetic polypeptide (CC Comprising a less than full length mainto acid sequence of a mutant CC R12/R261-2 associated cell death regulator polypeptide (BAD) or in the control of a mutant CC fragment, which contains amino acid substitutions at serila of a human CC BAD, Seril5 of a murine BAD (longer murine BAD) or Seril3 of a murine CC BAD (shorter murine BAD). (I) has immunostimulant, neuroprotective, controlled, antischaemic, vulnerary, cytostatic, antiviral, can be used as an apoptesis inducer or inhibitor. BAD plypeptides and complymucleatides can be used for screening candidate compounds and drugs inducting or inhibiting apoptesis in a cell. Candidate compounds and drugs inducting or inhibiting apoptesis in a cell. Candidate compounds and complymunostivity that promote cell survival or apoptesis, other uses include inducting or inhibiting apoptesis in a cell. Candidate compounds compounds and compounds and continuous diseases, neurodegenerative diseases, ischaemic cell death, reperfusion cell death, wound healing, cancer, vital infections, continuous diseases. The present sequence represents a BAD BH3 domain cellone present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

```

The invention relates to a peptide conjugate having the formula:  $(R\cdot X)n$ -peptide where n=1-16; X=C=0, when the  $R\cdot X$  group is attached to the N-terminus of the peptide, or a side chain of the peptide where the functional group of the side chain is NH2 or OH; or X=O or OH, when the  $R\cdot X$  group is attached to the C-terminus of the peptide, or a conside chain of the peptide, where the side chain functional group is OH or

New peptide conjugates for modulating apoptosis or for inhibiting cell lymphoma/leukemia 2 (BLI-2) function, especially useful for treating neurodegenerative disorders, stroke, or cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents the BH3 domain of mouse BAD.
The invention relates to a bcl homology domain 3 (BH3 domain),
The invention relates to a bcl homology domain 3 (BH3 domain),
derived from a proapoptotic member of the BCL-2 family. The
BH3 polypeptide can be used in a method for promoting apoptosis in a
BH3 polypeptide can be used in a method for promoting apoptosis in a
target cell, especially where the cell is a cancer cell a virus infected
cell or an autoautibody producing cell. The BH3 polypeptide can be used
in therapeutic compositions for treating disease including cancer, other
lymphoproliferative conditions, arthritis, inflammation, and autoimmune
diseases, which may result from the down regulation of cell death

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally components. Acquired with a 1-5C straight or branched chain alkyl group, phenyl optionally emonosubstituted with a 1-5C straight or branched chain companyl potentially emonosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptide with a 1-5C straight or branched chain companyl group, or benzyl. The peptide corresponding to amino acids 72-97 of the peptide portion of the conjugate AMB37001-BM3058 represent malogues cof a Bcl-2 superfamily polypeptide corresponding to amino acids 72-97 of the BH3 domain of the ceil death agonist Bad. The peptide conjugate is creversing B ceil jumphome/leukemia 2 (Bcl-2)-mediated blockage of spoptosis in cancor ceils. It is also useful for inhibiting Bcl-2 function. In particular, the peptide conjugate is useful for treating a collect affilicted with a cancer characterized by cancer ceils that carpers Bcl-2. The cancer includes prostate, colorectal, gastric, consersal lung, renai or thyroid cancers, neuroblastoma, melanoma, or scute or chronic lymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating disorders characterized by cancer field. The peptide conjugate is also useful for treating disorders, acquired increased apoptosis, e.g. neurodegenerative disorders, acquired conjugate is also useful for treating disorders, acquired conjugate is also useful for treating of sorders, acquired conjugate is also useful for treating the formal infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
The sequences given in AAR95155-67 represent epitopes derived from the murine bcl-x(L)/bcl-2 associated death promoter (Bad) polypeptide (see also AAR95168). Bad is a 22.1 kD protein which interacts with bcl-2 and bcl-x proteins and regulates cell death. It has homology to the bcl-2-related family clustered in the BH1 and BH2 domain. Bad has been found
                                                                                                                                                                                                                   Claim
                                                                                                                                                                                                                                                                          Polynucleotide encoding bcl-x(L)/bcl-2 associated death promoter weeful to treat nepplasia and apoptosis and to identify agents inhibiting its binding to bcl-2 or bcl-x(L) to form heteromultimers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Epitope; murine; bcl-x(L)/bcl-2 associated death promoter; Bad; stroke; polypeptide; bcl-x; cell death; regulate; BH1; BH2; apoptotic cell deat cytokine deprivation; Lr-3 dependent cell line; immunodeficiency; AIDS; neurodegenerative disease; senescence; ischaemia; neoplasia.

                                                                                                                                                                                                                                                                                                                  to hybridise to bcl-x(I) and bcl-2 in yeast two-hybrid assays and in vivo in mammalian cells. Overexpressed Bad counters the death inhibitory activity of bcl-x(I), but is much less effective at countering the death inhibitory activity of bcl-2. Bad expression can accelerate apoptotic cell death induced by cytokine deprivation in an II-3 dependent cell line expressing bcl-x(I), and its also counters the death repressor activity of bcl-x(I). Bad competes with Bax for binding to bcl-x(I). Bad competes with Bax for binding to bcl-x(I). Bad may be used to identify agents which inhibit its binding to bcl-x(I) or bcl-x(I), to form heterodimers. Such agents may be used to treat neurodegenerative diseases, immunodeficiency diseases, e.g. AIDS, neuroscapenerative diseases, immunodeficiency diseases, e.g. AIDS,

TISSUE SPECIFICITY: EXPRESSED IN A WIDE VARIETY OF TISSUES.

DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND
BAX for their pro-apoptotic activity and for their interaction
with anti-apoptotic members of the Bel-2 family.

PTM: Phosphorylated on Ser-75 in response to survival stimuli.
Subsequent phosphorylation on Ser-99 promotes heterodimerization
with 14-3-3 proteins. This interaction then facilitates the
phosphorylation at Ser-118, a site within the BH3 domain, leading
to the release of Bel-x(l) and the promotion of cell survival.

Ser-99 is the major site of AKT/PKB phosphorylation, Ser-118 the
major site of FAKT/PKB phosphorylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SIMILARITY: CONTAINS 1 BCL-3 HOMOLOGY DOMAIN 3 (BH3).

binding to Bel-X and Bel-W. Thereby affecting the level of heterodimerization of these proteins with BaX. Can reverse the death repressor activity of Bel-X(L), but not that of Bel-2. Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

1. SUBUNIT: Forms heterodimers with the anti-apoptotic proteins, Bel-X(L), Bel-2 and Bel-W. Also binds protein S100AiD (By similarity). The Ser-112/Ser-136 phosphorylatted form binds 14-3-3 proteins.

1. SUBCELDLAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm.

1. DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the Bel-2 family.

1. PTM: Phosphorylated on Ser-112 in response to survival stimuli. Subsequent phosphorylation of Ser-136 promotes heterodimerization with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-155, a site within the BH3 domain, leading to the release of Bel-X(L) and the promotion of cell survival. Ser-136 is the major site of AKT/PKB phosphorylation. Ser-155 the major site of protein kinase A (CAPK) phosphorylation.

1. SIMILARITY: COMMAINS a BEL-3 HOMOLOGY DOMAIN 3 (BH3).

DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the BC1-2 family.

PfW: Phosphorylated on Ser-II3 in response to survival stimuli. Subsequent phosphorylated on Ser-II3 in response to survival stimuli. Subsequent phosphorylation on Ser-II3 promotes heterodimerization with I4-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-IS6, a size within the BH3 domain, leading to the release of Bc1-x(L) and the promotion of cell survival.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ORYGRELRRMSDEF 158

"Cloning and expression of the Apali, Nspi, Nspil, Saci, Scai, and sapi restriction-modification systems in Escherichia coli.";

Mol. Gen. Genet. 260:226-231(1998).

1- FUNCTION: THIS METHYLASE RECOGNIZES THE DOUBLE-STRANDED SEQUENCE OTEGAC, CAUSES SPECIFIC METHYLATION ON C-7 ON BOTH STRANDS, AND PROTECTS THE DNA FROM CLEAVAGE BY THE APALI ENDONUCLEASE.

1- CATALYTIC ACTIVITY: S-adenosyl-L-methionine + DNA Cytosine = S-adenosyl-L-homocysteine + DNA 5-methylcytosine.

Submitted (SEP-1996) to the EMBL/GenBank/DDBJ databases.

1- FUNCTION: THE SIGMA FACTOR IS AN INITIATION FACTOR THAT PROMOTES ATTACHMENT OF THE RNA POLYMERASE TO SPECIFIC INITIATION SITES AND THEM IS RELEASED. THIS IS THE PRIMARY SIGMA-FACTOR OF THIS BACTERIA.

1- SIMILARITY: BELONGS TO THE SIGMA-70 FACTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SEQUENCE OF
